Note1) The instrument's apparent power (S), reactive power (Q), power factor (λ), and phase angle (Ø) are calculated using measured values of voltage, current, and active power. (However, reactive power is calculated directly from sampled data when TYPE3 is selected.) Therefore, when distorted waveforms are input, these values may be different from those of other measuring instruments based on different measuring principals.  
Note 2) The value of Q in the QS calculation is calculated with a preceding minus sign (-) when the current input leads the voltage input, and a plus sign when it lags the voltage input, so the value of QS may be negative.

45 Hz ≤ f < 440 Hz	0.15% of reading + 0.35% of range	0.15% of reading + 0.35% of range	0.25% of reading + 0.5% of range
440 Hz ≤ f < 1 kHz	0.2% of reading + 0.35% of range	0.2% of reading + 0.35% of range	0.4% of reading + 0.5% of range
1 kHz ≤ f < 2.5 kHz	0.8% of reading + 0.35% of range	0.9% of reading + 0.35% of range	1.7% of reading + 0.5% of range
2.5 kHz ≤ f < 5 kHz	3% of reading + 0.35% of range	3% of reading + 0.35% of range	6% of reading + 0.5% of range

However, all the items below apply to all tables.

- When the crest factor is set to 3
- When  $\lambda$  (power factor) = 1
- Power figures that exceed 440 Hz are reference values.
- For nth order component input, add  $(n/(m+1))/50\%$  of (the nth order reading) to the n + mth order and n-mth order of the voltage and current.
- For the n+mth order and n-mth order of power, add  $(n/(m+1))/25\%$  of the nth order reading.
- Add  $(n/500)\%$  of reading to the nth component of the voltage and current, and add  $(n/250)\%$  of reading to the nth component of the power.
- Accuracy when the crest factor is 6: The same as when the range is doubled for crest factor 3.
- The accuracy guaranteed range by frequency and voltage/current is the same as the guaranteed range of normal measurement. If the amplitude of the high frequency component is large, influence of approximately 1% may appear in certain orders. The influence depends on the size of the frequency component. Therefore, if the frequency component is small with respect to the range rating, this does not cause a problem.
